## iSolar 400/800 solar panel cleaner

The iSolar accessories system is a complete modular solution that offers all the necessary products for your cleaning needs, from water connections to brushes. This system is also compatible with many Kärcher pressure washers, meaning, existing pressure washers can usually be used to operate iSolar. Because the system is modular, we can build a custom solution to fulfill any requirement.

The iSolar 400 and iSolar 800 offer superior and safe cleaning, thanks to brushes powered by a pressure washer's water jet. ## Kärcher Tuff-Skin hose.

There is no other high-pressure hose as tough as Kärcher's Tuff-Skin™ hose. When tested to ISO 6945 / DIN 20024, the Tuff-Skin has proven to be seven times more abrasion resistant than standard pressure washer hoses, yet is 20% more flexible. The Tuff-Skin, with its unique design, has been engineered for a greater continuous temperature range—from -40° to 275°F / 310°F intermittent—and for handling pressures of up to 6000 PSI.

Beside its maximum-strength Class A ORS (Oil Resistance Standard)—most other brands are Class B—the Tuff-Skin has a “bite-the-wire” coupling that grips the hose better than any other design.

Both single-and double-wire braid hoses come with Kärcher's branded durable plastic sleeves on both ends—a 24-inch sleeve on the gun end—for added operator protection against high-pressure bursts.

## Nozzles and Power nozzles.

The Kärcher Power Nozzle, developed and patented by Kärcher, offers a performance that is distinctly better than that of conventional nozzles:

The concentrated spray jet of large coherent droplets is sharp-contoured and increases impact pressure by up to 40%. This produces a considerable improvement in cleaning efficiency.

Assuming the same degree of soiling, the Power Nozzle cleans at a much faster rate and, an environmentally friendly benefit, uses less water and cleaning agent.

The Power Nozzle's spray jet cleans with the same high-impact pressure over its whole working width. This provides substantially more cleaning power for a given amount of energy.

## Axial pumps, repair kits and tools.

Kärcher's commercial-duty 3-piston axial pumps are simple, efficient, and very reliable and have fewer moving parts compared to crank-case and piston type pumps.

These proprietary pumps are engineered for long life with features like brass cylinder heads, ceramic pistons, and stainless steel valves. Kärcher's combined pump/motor units run cooler due to their unique water cooled design. And they use less power thanks to a unique drive center and wobble plate design.

Kärcher pumps feature a soft-dampening system to reduce pulsations in the high pressure system, increasing the service life of high pressure components.

## Kärcher K3 pumps.

The U-Seals provide better run-dry protection, extend pump life, and allow for inlet water of up to 185°F. Kärcher K3 pumps provide a stronger crankcase with thicker mounting feet and extra-large European made tapered roller earings for longer pump life. The crankcase is reinforced and comes with the new O-ring seal for leak-free operation. Specially die cast connecting rods provide for quieter operation and longer pump life.

## Coils.

Kärcher's proprietary heating coil is unequalled in the industry for its high heating performance, compact design, and super-efficiency. Double-wall construction—with air passing between the two walls—provides insulation as well as oxygen for the combustion process.

The combustion chamber and heating coil provide even heat distribution with very little condensation or corrosion and 92%+ fuel efficiency to conform to the strictest air quality standards.

Combined with other Kärcher advances, our heating coil helps make Kärcher the responsible choice with the lowest cost of operation in the industry.

# NOZZLES

## Nozzle Size Selection Chart

Determine the nozzle size by the pressure washer's GPM @ PSI (gallons per minute @ a specific pounds per square inch). If the nozzle size is too small, your equipment can be damaged. If the nozzle size is too large, cleaning ability is compromised. Nozzle fan degree does not effect nozzle size selection.

## Nozzle Fan Selection

Select the nozzle degree or spray angle, based on your application. Standard nozzle degrees — 0°, 15°, 25°, and 40°. Using the wrong nozzle degree can damage the surface you are cleaning.

**Cutting nozzle.** It delivers a concentrated stream that can gouge or cut. It can cut stubborn stains from concrete and other hard surfaces.

**Chiseling nozzle.** Working at a 45° angle, this nozzle works like a scraper, stripping paint, grease and grime from hard surfaces.

**Flushing nozzle.** The most commonly used nozzle for cleaning dirt from siding, sidewalks and metal furniture as well as for wet sweeping leaves.

**Wash nozzle.** Its wide spray allows you to wash and rinse a large area fast. It is usually safe with most surfaces, including aluminum siding, windows and vehicles.

## Packing Extractor

Virtually unbreakable sockets will pull packings from Interpump, General and other brand pumps.

**Easy to use:** Slide-Hammer (shown below) attaches to slotted socket—which expands inside the packing gland. The slide hammer then pops the packing gland brass out of the head to facilitate easy seal repairs without damage to brass support rings.

## Pump Technical Information

### Correct pump installation is essential for optimum performance.

It is recommended that the pump flow capacity be oversized for the actual flow required. For optimum running of the system, the water circulated through the regulating valve should not exceed 10-15% of the pump flow. Recirculating too much water can generate heat in the supply tank increasing the cavitation risk.

### Frequently Asked Questions:

**Question:** How much should you reduce the pump RPM to achieve a lower flow capacity?

**Answer:** required RPM = expected capacity  $\times \frac{\text{max RPM allowed}}{\text{max allowed capacity}}$

**Question:** What diameter of pulley must I use to achieve the correct pump RPM?

**Answer:** external diameter of the engine / motor pulley = external diameter of the pump pulley  $\times \frac{\text{pump RPM}}{\text{engine / motor RPM}}$

**Question:** What if I cannot change the engine / motor pulley?

**Answer:** external diameter of the pump pulley = external diameter engine / motor pulley  $\times \frac{\text{engine / motor RPM}}{\text{pump RPM}}$

**Question:** If the engine / motor is running at a lower RPM than the maximum pump RPM allowed, what will be the pump flow capacity?

**Answer:** attainable maximum capacity = engine / motor RPM  $\times \frac{\text{max capacity indicated on the label}}{\text{max RPM indicated on the label}}$

**Question:** What is the approximate power required to achieve the maximum performances allowed?

**Answer:** required electric motor HP  $\frac{\text{PSI} \times \text{GPM}}{1460} = \text{Electric Motor HP}$

required gas engine HP  $\frac{\text{PSI} \times \text{GPM}}{1460} \times 1.30 = \text{Gas Engine HP}$

**Conditions to prevent pump cavitation: Minimum difference in height HZ (pos / neg) between pump and water level.**

The minimum inlet pressure value of the pump is limited by the cavitation phenomenon. Cavitation is the forming of vapor bubbles when the local pressure is below the vapor pressure of the liquid. Bubbles flow together with the liquid and when they reach a higher pressure area, they collide, generating abnormal stresses that are extremely dangerous to the pump components. To avoid the risk of cavitation, it is necessary that the pump installation is correct.

## Reference / Calculation Guide

### Conversion Factors

1 inch = 25.4 mm	1 gal H <sub>2</sub> O = 8.33 lbs	1 gal = 3.79 liter	1 kg = 2.205 lbs
1 cm = 0.394 inch	1 oz = 23.35 gram	1 liter = 0.2642 gal	1 KW = 1.341 HP

### Horsepower (HP) Equations

$$HP = \frac{GPM \times PSI}{1460}$$

$$PSI = \frac{HP \times 1460}{GPM}$$

$$GPM = \frac{HP \times 1460}{PSI}$$

How fast do I turn my pump to give me a desired GPM?

Required RPM =  $\frac{\text{desired GPM} \times \text{Rated RPM}}{\text{Rated GPM}}$

What size pump pulley do I use to get a certain RPM?

Pump Pulley Diameter =

$$\frac{\text{Motor Pulley Diameter} \times \text{Motor RPM}}{\text{Pump RPM}}$$

### "Snap" Fuel Nozzle Check Valve

Spring-loaded "snap" check valve replaces filter element on fuel nozzle. Valve opens when fuel pump pressure reaches 130 PSI and "snaps" shut when fuel pressure drops below 130 PSI. Stops "smokey" burners at start-up and eliminates "shutdown" after burn.

- Reduces nozzle fouling caused by residual fuel in orifice
- Easy field installation in standard fuel nozzles
- Reduces soot build-up in coil

## Yamada Pumps

**yamada**

8.702-180.0

8.702-183.0

**Air-powered double diaphragm pump, "Reliable Performance Since 1905".** The answer to difficult product transfer problems. Air-drive allows freedom from electrical hazards or explosion-proof motor requirements. Choose from various wetted-parts materials to customize the pump to the chemical being pumped. Yamada's smaller pumps are often used for pumping car wash chemical for 'low-pressure' functions. The 1/2" pump is also ideal for rapidly pumping oil, soap, etc., from 55 gallon barrels. Larger pumps are used for high-volume product transfer. Since all pumps are designed without rotating parts, they can also handle abrasive liquids such as ceramic slip, sand slurry, or enamel frit without damage.

**Have a unique challenge? Call us for help!**

- Environmentally-friendly non-lube air valve
- Automatic start/stop
- Infinitely variable flow control regulated by opening or closing discharge side valve and/or fluctuating air supply
- Non-stalling air valve — positive switching every stroke and won't ice up
- Outside accessible air valve — easy inspection and maintenance
- Bolted flange connections — leak-free and easy maintenance
- Built-in abrasion and chemical-resistance
- Virgin diaphragm materials last twice as long as other pumps
- 100 PSI
- 180°F
- 1/4" model deliver 3.4 GPM with 20-100 PSI drive air
- 1/2" models deliver 15 GPM with 20-100 PSI drive air

## Solenoid Valves

Dependable, cost-effective solutions to valve challenges.

### Suitable for:

- Air
- Chemicals
- Light oil
- Low pressure steam

### Water Solenoid Valves 2-way, normally closed.

The S211 Series Standard Water Valves have reliable piloted diaphragm construction with proven performance over decades of use. Featuring stainless-steel seats, the S211 Series typically requires 4 or 5 PSI pressure differential to open. The S201 Series Zero Differential Valves are constructed with the same materials, but are capable of operating with the same amount of pressure on both sides of the valve. Both valve types are often utilized in the car wash industry.

### Chemical Solenoid Valves 2-way, normally closed.

For decades, car wash industry professionals have chosen the rugged S301 and S311 Series Valves because of their compact size and long life. Available in 1/8", 1/4" and 3/8" NPT designs, these valves are used in air, water and chemical applications.

- Professional car washes
- Other industrial applications

### High-pressure Solenoid Valves 2-way, normally closed.

The S401 High-Pressure Valves are compact, dependable and specially designed by ITT to meet car wash applications up to 1400 PSI. **Best Buy**

### Normally Open Solenoid Valves for Car Wash Anti-Freeze Applications.

These valves provide long life and reliable performance in the "make or break" anti-freeze systems of car washes. The S202 and S212 Series Diaphragm Valves feature non-wicking, fabric-reinforced diaphragms, which eliminates premature diaphragm failures, as well as stainless-steel upper seats, which prevents seat deterioration often associated with brass-seated valves. The S202 Series Diaphragm Valve incorporates the zero-operating pressure design discussed above; the S212 Series is a piloted diaphragm, and the S402 Series is a piloted piston valve.

## Aqua Master™ Model 440

**DEMA**

**Liquid level proportioning controls** — automatically maintain drum level and chemical concentration. The Aqua Master automatically maintains a desired level of proportioned mixture in a drum, tank or other type reservoir.

Magnetically activated "snap acting" float valves provide full water flow to activate the chemical proportioners. There are two basic sizes to give a choice of water flows as shown in the table below. Chemical feed rate is adjusted by metering screw or threaded metering tips. The compact 440 float valve is made of Celcon® plastic and is easily accessible for field maintenance.

Liquid-level proportioning controls are available in two flow capacities, 4 and 22 GPM at 50 PSI. Either size can be used with or without a proportioner. The proportioner allows chemical to be inducted while the valve is open.

All models, except as noted, are equipped with siphon breakers to prevent backflow into the fresh water line. The proportioner discharge is provided with means for attaching a hose or piece of pipe for under water feeding to minimize sudsing.

Model	Description	Capacity
440-23BT	Proportioning Valve, 4 GPM Flow at 50 PSI, Medium Capacity	12*
440-23T	Proportioning Valve, 4 GPM Flow at 50 PSI, High Capacity	35*
440-24	Proportioning Valve, 4 GPM Flow at 50 PSI, Highest Capacity	70*
